If a scatter plot seems to follow a curved trend, then there may be a quadratic or cubic relationship between the data instead of a linear relationship. To determine the curve of best fit the same procedures are used as in last lesson.

Example 1: A pebble falls from a Cliffside into the river 30 m below. This table gives the height of the pebble as it falls.

| Time (s) | $\times$ | 0 | 0.5 | 1 | 1.2 | 1.5 | 2.0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Height (m) | y 30.00 | 28.77 | 25.11 | 22.97 | 18.98 | 10.42 |  |

a) Use quadratic regression to determine the equation of the curve of best fit.

$$
\begin{aligned}
& y=a x^{2}+b x+c \\
& y=-4.9 x^{2}+0.015 x+30
\end{aligned}
$$

b) Use your equation to determine the height of the pebble after 1.25 s .

$$
\begin{aligned}
y & =-4.9\left(1.25^{2}\right)+0.015(1.25)+30 \\
& =22.36
\end{aligned}
$$

c) When does the pebble hit the river, to the nearest hundredth of a second?

$$
\begin{aligned}
& 0=-4.9 x^{2}+0.015 x+30 \\
& x=2.5
\end{aligned}
$$

Example 2: A biochemist is studying the growth of recently discovered bacteria. She collects the data shown.

| Day | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Mass (g) | 3.2 | 4.6 | 5.4 | 4.2 | 5.5 | 7.1 | 8 | 9.2 |

a) Use cubic regression to determine the equation of the curve of best fit for the data.

$$
y=0.023 x^{3}-0.23 x^{2}+1.26 x+2.44
$$

b) Estimate the mass of the bacteria on Day 11 .

$$
19.04
$$
