## Year End Review: Polynomial, Exponential, and

## Logarithmic Functions (Units 6 \& 7)

A polynomial function in one variable is a function that contains only the operations of multiplication and addition, with real-number coefficients, whole-number exponents, and two variables. The degree of the function is the greatest exponent of the function. For example, $f(x)=6 x^{3}+3 x^{2}-4 x+9$ is a polynomial function of degree 3. More specifically, it is a cubic function due to its degree is 3 .

The graphs of polynomial functions of the same degree have common characteristics.
The end behaviour of a graph is the description of the shape of the graph, from left to right, on the coordinate plane. Cartesian grids are divided into four quadrants by the x axis and $y$-axis.

Any point where the graph of a function changes from increasing to decreasing or from decreasing to increasing is called a turning point.

The domain is the set of all x values of a graph while the range of a function is the set of all y values of a graph.

The x -intercepts are where the graph crosses the x -axis and the y -intercepts are where the graph crosses the $y$-axis.

Example 1: Complete the following chart:

| Function | $\mathbf{f}(\mathbf{x})=\mathbf{3 x}+2$ | $\mathbf{g}(\mathbf{x})=\mathbf{x}^{3}+\mathrm{x}^{2}+2 \mathrm{x}-2$ |
| :---: | :---: | :---: |
| Degree | 1 | 3 |
| Number of x-intercepts | 1 | 1 |
| Y-intercept | 2 | -2 |
| End Behaviour | III $\rightarrow I$ | $I \mathbb{I} \rightarrow I$ |
| Domain | $x \in \mathbb{R}$ | $x \in \mathbb{R}$ |
| Range | $y \in \mathbb{R}$ | $y \in \mathbb{R}$ |
| Number of Turning Points | 0 | 2 |

An exponential function is of the form $y=a(b)^{x}$ where $a \neq 0, b>0$, and $b \neq 1$. The graphs of exponential function are very unique.

The function $\mathrm{y}=\log _{10} \mathrm{x}$ is equivalent to $\mathrm{x}=10^{\mathrm{y}}$, so a logarithm is an exponent. The meaning of $\log _{10} \mathrm{x}$ is "the exponent that must be applied to base 10 to get the value of x ". For example, $\log _{10} 100=2$.

The expression $\log _{10} \mathrm{x}$ is known as the common logarithm or a logarithm with a base of 10. The expression is often written without the 10 , so the two functions $\mathrm{y}=\log _{10} \mathrm{x}$ and $y=\log x$ are equivalent.

The symbol e is a constant known as Euler's number. It is an irrational number that equals $2.718 \ldots$. A logarithm with base $e$ is called the natural logarithm and is written as $\ln x$.

Example 2: Complete the following chart.

| Function | $\mathrm{y}=5(2)^{x}$ | $\mathrm{y}=4 \mathrm{C}^{(1 / 2)^{x}}$ | $y=-4 \log x$ | $y=13 \ln x$ |
| :---: | :---: | :---: | :---: | :---: |
| Number of $\mathbf{x}$ Intercepts | 0 | 0 | 1 | 1 |
| Y-intercept | 5 | 4 | none | none |
| End Behaviour | $I \rightarrow I$ | $I \mathrm{I}$ | $I \rightarrow I$ | IV $\rightarrow$ I |
| Domain | $x \in \mathbb{R}$ | $x \in \mathbb{R}$ | $x>0$ | $x>0$ |
| Range | $y>0$ | $y>0$ | $y \in \pi$ | $y \in \mathbb{R}$ |
| Increasing/ Decreasing | inc | dec | dec | inc |

When determining an equation that best fits the data, a graphing calculator must be used.
Example 3: Determine the equation of the exponential regression function of the following data.

| $\mathbf{x}$ | 0 | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{y}$ | 0.0 | 2.1 | 4.2 | 6.3 | 8.4 |

$$
y=1,48(1,58)^{x}
$$
